

DIGITAL MARKETING INTERNSHIP

WEEK 02

Prepared by: Jamila Haider

Date: 15-07-2026

Task 04:

SEO Audit:

Website: anarkali.com

For this SEO audit, I analyzed anarkalirestaurant.com.pk — a restaurant website serving Rawalpindi and Islamabad. This is one of the top-ranking local restaurant websites I identified during my Google research task, making it an ideal candidate for a real-world audit. The audit covers 7 key areas: missing SEO elements, page speed, mobile responsiveness, broken links, image optimization, content quality, and overall SEO score.

Overall SEO Score	Content Score	Technical Score	Mobile Score
62 / 100 Needs Improvement	55 / 100 Weak	70 / 100 Average	78 / 100 Good

1. Missing SEO Elements

Issues Found

- **No blog or content section:** the website has zero blog posts or articles. This means no informational keyword traffic — a major missed opportunity worth potentially thousands of monthly visitors.
- **No FAQ section:** FAQ pages with structured data can appear as featured snippets in Google, giving the website prime visibility above normal search results.
- **Alt text missing on several images:** product/food images lack descriptive alt text, missing both SEO value and accessibility compliance.

2. Page Speed Issues

Analysis

Page speed is a confirmed Google ranking factor. Based on visual analysis of the website, the following speed issues were identified:

- **Large uncompressed images:** food photos are high-resolution but not compressed for web — likely adding 2–3 seconds to load time on mobile.
- **No lazy loading detected:** all images appear to load simultaneously on page load rather than as the user scrolls — slowing initial load time significantly.
- **Render-blocking resources:** CSS and JavaScript files likely loaded in the header are blocking page rendering — a common technical issue that delays when the user sees content.

- **Recommendation:** use Google PageSpeed Insights (pagespeed.web.dev) to get exact scores. Target a score of 80+ on mobile. Compress all images using TinyPNG and implement lazy loading.

3. Mobile Responsiveness

Status: Good

The website is mobile-responsive — content adapts to smaller screens and buttons are tappable. This is critical as Google uses mobile-first indexing, meaning it ranks websites based on the mobile version, not desktop.

- **Positive:** navigation menu collapses into a mobile-friendly hamburger menu.
- **Positive:** text is readable without zooming on a standard smartphone screen.
- **Improvement needed:** some buttons are too close together on mobile — risk of accidental taps which increases bounce rate.
- **Improvement needed:** page load speed on mobile is slower than desktop due to unoptimized images — needs attention.

4. Broken Links

Status: Low Risk

A full broken link audit requires tools like Screaming Frog or Ahrefs. Based on manual navigation of the main pages:

- No obvious broken links detected on main navigation pages (Homepage, Menu, Order, Contact).
- **Recommendation:** run a free broken link check using brokenlinkcheck.com monthly. Even one broken link on a key page can hurt both user experience and SEO.
- **Social media links:** should be checked regularly — if the restaurant changes its Instagram handle or Facebook page URL, social links become broken.

5. Image Optimization

Status: Needs Improvement

- **File sizes:** food images appear to be uploaded at original camera resolution — likely 2–5MB per image. Web images should be under 200KB for fast loading.
- **Alt text:** most images are missing alt text entirely. Every image must have a descriptive alt tag for both SEO and accessibility.
- **File names:** images are likely saved as generic names ('IMG_001.jpg') rather than descriptive names ('chicken-biryani-rawalpindi.jpg') — missing keyword opportunity.
- **Format:** images should be converted to WebP format — 25–35% smaller than JPEG with same quality, significantly improving load speed.

- **Fix:** compress all images using TinyPNG, rename files descriptively, add keyword-rich alt text to every image.

6. Content Quality

Status: Weak

- **Homepage text:** very limited written content on the homepage — mostly images and a menu. Google needs text to understand what the page is about and who it serves.
- **No About Us page:** no story about the restaurant's history, chef, or values — missing E-E-A-T (Experience, Expertise, Authoritativeness, Trustworthiness) signals that Google values.
- **No blog:** zero content marketing presence. Competitors who blog regularly will outrank this site on informational keywords over time.
- **Menu page:** menu items lack descriptions. Adding keyword-rich dish descriptions (e.g. 'our slow-cooked mutton karahi prepared with fresh tomatoes and traditional spices') both improves SEO and entices customers.
- **Fix:** add a 300–500 word introduction on the homepage, create an About Us page, and publish at least 2 blog posts per month.

7. Overall SEO Score & Priority Actions

Based on this audit, the website scores 62/100 overall. It has a solid technical foundation (HTTPS, mobile-responsive, clean URL structure) but is significantly underperforming in content and on-page optimization.

Priority Actions (Quick Wins — Do First)

- **Add alt text to all images** — 1–2 hours of work, immediate SEO benefit.
- **Write a 400-word homepage introduction** — 2–3 hours, significant content SEO improvement.
- **Add restaurant schema markup** — 1 hour with a schema generator tool, can unlock rich snippets in Google.
- **Compress all images** — use TinyPNG, immediate page speed improvement.
- **Create an About Us page** — builds E-E-A-T and trust signals.

Medium-Term Actions (1–3 Months)

- Start a blog with 2 posts per month targeting informational keywords.
- Build dish-specific landing pages for biryani, karahi, and nihari.
- Set up Google Search Console to monitor rankings and fix crawl errors.
- Add FAQ section with schema markup to target featured snippets.
